Adaptive Color Contrast Enhancement For

Adaptive contrast is very different than auto-brightness (or adaptive brightness) found under Settings > System > Display, which ramps up and down the display backlight on ambient lighting conditions. Adaptive contrast differs because it adjusts based on the current image on your display rather than the ambient light in your room.

Display contrast ratio is affected independently from the bright and dark ends of the range and therefore the contrast ratio must be adapted independently. LACE display Technology is very effective here because of the fact that it enables independent adjustment of bright and dark regions of each frame thereby having the brightness to

Localized Adaptive Contrast Enhancement (LACE)

Microsoft's Surface PCs ship with an adaptive contrast setting that automatically adapts the contrast on the screen to provide the best image depending on the environment. While adaptive contrast is a useful and desirable feature, it doesn't do much for you if you desperately need your PC to retain the same level of contrast throughout and would prefer it to not change aspects of the display.

Contrast enhancement of color images is typically done by converting the image to a color space that has image luminosity as one of its components, such as the L*a*b* color space. Contrast adjustment is performed on the luminosity layer 'L*' only, and then the image is converted back to the RGB color space. Manipulating luminosity affects the intensity of the pixels, while preserving the original colors. Read an image into the workspace. The 'shadow.tif' image is an indexed image, so convert ...

A global and local contrast enhancement method is proposed for adaptively enhancing the non-uniform illumination images. Firstly, a novel global contrast adaptive enhancement algorithm obtains the global enhancement image. Secondly, a huepreserving local contrast adaptive enhancement algorithm produces the local enhancement image.

Adaptive contrast enhancement methods with brightness preserving Abstract: Brightness preserving methods are very high demand to the consumer electronic products. Numerous histogram equalization (HE)-based brightness preserving methods tend to produce unwanted artifacts. Thus, we propose two methods to overcome the drawbacks.

First, contrast-limited adaptive histogram equalization (CLAHE) was adopted to improve the global contrast; then, the low-frequency component and several high-frequency components were used to enhance the edge detail. The experimental results indicated the superiority of the proposed method in terms of the visual effect.

Secondly, a hue- preserving local contrast adaptive enhancement algorithm produces the local enhancement image. Finally, a contrast- brightness-based fusion algorithm obtains the final result, which represents a trade-off between global contrast and local contrast. This method improves the visual quality and preserves the image naturalness.
