In Poisson distribution, the mean of the distribution is represented by λ and e is constant, which is approximately equal to 2.71828. Then, the Poisson probability is: $P(x, \lambda) = (e^{-\lambda} \lambda^x) / x!$ In Poisson distribution, the mean is represented as $E(X) = \lambda$. For a Poisson Distribution, the mean and the variance are equal. It means that $E(X) = V(X)$ Where,

What Is Poisson Distribution? The Poisson Distribution is a discrete distribution. It is named after Simeon-Denis Poisson (1781-1840), a French mathematician, who published its essentials in a paper in 1837. The Poisson distribution and the binomial distribution have some similarities, but also several differences.

Poisson Distribution (video lessons, examples and solutions)

APPLICATIONS OF THE POISSON The Poisson distribution arises in two ways: 1. Events distributed independently of one another in time: X = the number of events occurring in a fixed time interval has a Poisson distribution. PDF : $p(x) = e^{-\lambda} \lambda^x / x!$, $x = 0, 1, 2, \dots; \lambda > 0$ Example: X = the number of telephone calls in an hour. 2.
